Vejledning vedrørende Laika

Laika has been examined in Gråsten Denmark at the veterinary Stig Majlandt with special interest for heartdiseases in dog.

Was also examined in april and has an heartcontraction (FS) 14 % and should be at least 30% . The diameter in left heartventrikel was 3,9 cm and should be below 4 cm so no dilation in left ventrikel all measured by ultrasound.

To day 03-09-13 Laika was examined again inkluded the ultrasound again. This time the FS was 45% left heartventrikel was 2,9 cm and the volumenkontraktion EF (ejektionfraktion) was 55 % and should be at least 50-55 % in dogs.

Conclusion : Laika dosent suffer from an Primary DCM (dilated cardio myopathi) but sekundary DCM where hypothyroidisme is the primary reason. When Laika is under control for the Hypothyroidisme there will be no DCM and then the heart will have no problem.

Any quistion dont hesitate to call me 0045 74650022
